The most common use for drawing exchange formats (DXF, DWG, DGN) is for source data that will be used in a drawing. Often, these formats are used for exchanging information between different programs. Other common uses for drawing exchange formats are: Import and export of drawing information to and from various drawing and modeling applications. For example, a building plan is saved to a DXF file so that it can be imported into AutoCAD Crack Keygen Civil 3D, or imported into a text editor so that it can be saved as a text file. Basic features AutoCAD Crack For Windows provides numerous functionality features for architectural design and construction including: Design; drafting; visualization; placement; text; creation; dimensioning; and editing; handling of both 2D and 3D drawing information; import and export of drawings; importing and exporting of architectural data, including points, arcs, lines and surfaces; and exporting and importing DWG, DGN, DXF and DTM files. AutoCAD Product Key is a GIS (Geographic Information System) program and the ability to import data from maps, other CAD programs, and other computer programs is also provided. Drawing information is usually in the form of data blocks, which are represented by rectangles that have various attributes such as color, line style, fill pattern and location. AutoCAD draws the lines and other objects (e.g., arcs, surfaces, and text) on the data blocks and shows the geometry on the screen. Drawings can be edited, manipulated, and viewed from many different angles. The standard front view is called plan view. Other views are right-side view, rear view, isometric view, three-dimensional (3D) view, top view, wireframe, and exploded view. A fourth view is "profile view" which combines the plan view and top view, allowing one to view the profile of a 3D object. A profile view can also be viewed as an annotated drawing. One of the main purposes of profile view is to check for detail and accuracy of the architectural model. A "cutaway" view, or "section view", is available to show a cross-sectional view of an object that was created in 3D drawing. Other views such as "blending views" are used to blend or merge two or more drawings together. View panning is used to navigate from one view to another. Many 3D objects have surfaces, such as walls and columns, which consist of polygons a1d647c40b
